

Sprawozdanie

Uwagi

- Jeśli jakiś skrypt nie zadziałał poprawnie zalecam sprawdzić co się w nim znajduje i włączać komendy jedna po drugiej, żeby znaleźć źródło problemu.
- Moje zmienne środowiskowe:

```
export REGION=europe-west4  
export ZONE=${REGION}-c  
export CLUSTER_NAME=bigdata-intro  
export PROJECT_ID=$(gcloud config get-value project)
```
- mój bucket nazwałem flight-data-kafka-streams
- dane o lotniskach:
www.cs.put.poznan.pl/kjankiewicz/bigdata/stream_project/airports.csv
- dane o lotach:
www.cs.put.poznan.pl/kjankiewicz/bigdata/stream_project/flights-2015.zip

Jak uruchomić?

1. Skopiuj do swojego bucketa (zapamiętaj nazwę swojego bucketa, przyda się przy uruchamianiu jednego ze skryptów).
 - dane o lotniskach do folderu “airports”
 - spakowane w zip dane o lotach do folderu “flights” (to może chwile zająć)
 - producenta flight-data-processing-kafka-streams.jar
 - aplikację do przetwarzania danych KafkaProducer.jar
 - folder “scripts”

The screenshot shows the Google Cloud Storage 'Bucket details' page for 'flight-data-kafka-streams'. The bucket is located in 'europe-west4 (Netherlands)', uses 'Standard' storage class, and has 'Not public' access. The 'OBJECTS' tab is selected, showing a list of files and folders. The list includes 'KafkaProducer.jar' (3.3 KB), 'airports/' (Folder), 'flight-data-processing-kafka-strea...' (30.8 KB), 'flights/' (Folder), and 'scripts/' (Folder). The table columns are Name, Size, Type, Created, Storage class, Last modified, and an icon column.

Name	Size	Type	Created	Storage class	Last modified
KafkaProducer.jar	3.3 KB	application/java-archive	Jun 5, 2023, 11:13:57 PM	Standard	Jun 5, 2023, 11:13:57 PM
airports/	—	Folder	—	—	—
flight-data-processing-kafka-strea...	30.8 KB	application/java-archive	Jun 6, 2023, 4:45:16 PM	Standard	Jun 6, 2023, 4:45:16 PM
flights/	—	Folder	—	—	—
scripts/	—	Folder	—	—	—

2. Uruchom klaster

```
gcloud dataproc clusters create ${CLUSTER_NAME} \  
--enable-component-gateway --region ${REGION} --subnet default \  
--master-machine-type n1-standard-2 --master-boot-disk-size 50 \  

```

```

--num-workers 2 --worker-machine-type n1-standard-2 --worker-boot-disk-size
50 \
--image-version 2.1-debian11 --optional-components DOCKER,ZOOKEEPER \
--project ${PROJECT_ID} --max-age=3h \
--metadata "run-on-master=true" \
--initialization-actions \
gs://goog-dataproc-initialization-actions-${REGION}/kafka/kafka.sh

```

3. Uruchom 4 terminale

- serwerowy - do uruchamiania skryptów i uruchomienia producenta
- odbiorczy_1 - do odbierania danych etl
- odbiorczy_2 - do odbierania danych o anomaliach
- strumieniowy - do uruchomienia aplikacji do przetwarzania danych

4. Przygotuj skrypty

```
hadoop fs -copyToLocal gs://flight-data-kafka-streams/scripts
```

```
chmod +x scripts/*
```

5. Skopiuj potrzebne dane z bucketa

```
./scripts/01_download_data.sh NAZWA_TWOJEGO_BUCKETA
```

Jako argument przekaz nazwę swojego bucketa. Skrypt powinien skopiować dane o lotniskach i lotach, producenta kafki, aplikację do przetwarzania danych. Następnie powinien stworzyć odpowiednie foldery, przenieść do nich dane, odpakować dane związane z lotami oraz usunąć plik .zip.

6. Przygotuj tematy kafki

```
./scripts/02_prepare_kafka.sh
```

Skrypt ma za zadanie usunąć tematy kafki (nie przejmuj się errorami jeśli tematy nie istnieją), stworzyć tematy kafki oraz przesłać statyczne dane do jednego z tematów.

7. Włącz konsumenta dla etl (terminal odbiorczy_1)

```
./scripts/03_start_etl_consumer.sh
```

Skrypt ma za zadanie włączyć konsumenta dla danych etl. Po kliknięciu enter możesz przejść do kolejnego kroku, konsument zaczął działać.

8. Włącz konsumenta dla anomalii (terminal odbiorczy_2)

```
./scripts/04_start_anomaly_consumer.sh
```

Skrypt ma za zadanie włączyć consumera dla anomalii. Po kliknięciu enter możesz przejść do kolejnego kroku, konsument zaczął działać.

9. Włącz producenta, który będzie generował dane dotyczące lotów (terminal serwerowy)

```
./scripts/05_run_kafka_producer.sh
```

Producent powinien generować dane do tematu *flights-input* korzystając ze 100 plików, w których są przechowywane. Po kliknięciu enter możesz przejść do kolejnego kroku, producent zaczął wysyłać dane..

10. Włącz aplikację do przetwarzania danych (terminal strumieniowy)

Przed włączeniem aplikacji ustaw **CLUSTER_NAME**, aby kafka poprawnie zadziałała:

```
CLUSTER_NAME=$(/usr/share/google/get_metadata_value  
attributes/dataproc-cluster-name)
```

a) Działanie w trybie A + mało anomalii

```
java -cp /usr/lib/kafka/libs/*:flight-data-processing-kafka-streams.jar  
org.example.ProcessFlightApplication 45 10 A ${CLUSTER_NAME}-w-0:9092
```

```

10. Obserwuj pojawiające się dane w konsumerach etl i anomalii.

- dane prawdopodobnie nie pojawią się od razu, trzeba chwilę poczekać, na pojawienie się pierwszych wyników.
- jeśli chcesz zmienić parametry przy uruchamianiu aplikacji do przetwarzania danych to po prostu przerwij działanie programu (ctrl + c) i włącz z nowymi parametrami

Opis

Producent; skrypty inicjujące i zasilający

- skrypty należy skopiować do bucketa
- skrypty należy skopiować z bucketa ***hadoop fs -copyToLocal gs://flight-data-kafka-streams/scripts***
- należy dodać możliwość wykonywania się skryptom ***chmod +x scripts/****
- skrypt tworzący i usuwający tematy kafki: ***./scripts/02_prepare_kafka.sh***
- skrypty zasilające tematy kafki: ***./scripts/02_prepare_kafka.sh*** (airports) i ***./scripts/05_run_kafka_producer.sh*** (flights)
- skrypty uruchamiające konsumerów: ***./scripts/03_start_etl_consumer.sh*** (etl) i ***./scripts/04_start_anomaly_consumer.sh*** (anomalie)

Utrzymanie obrazu czasu rzeczywistego – transformacje

```
KTable<Windowed<String>, FlightDataRecord> flightDataRecords = flightRecords
    .filter((key, value) -> isCorrectInfoType(value)) KStream<String, FlightRecord>
    .selectKey((key, value) -> FlightRecord.parseOrderColumns(value.getOrderColumn()))
    .groupByKey(Grouped.with(Serdes.String(), flightSerde)) KGroupedStream<String, FlightRecord>
    .windowedBy(TimeWindows.ofSizeWithNoGrace(Duration.ofDays(1))) TimeWindowedKStream<String, FlightRecord>
    .aggregate(
        FlightDataRecord::new,
        (key, value, aggregate) -> {
            if (value.getInfoType().equals("D")) {
                aggregate.setDepartureAmount(aggregate.getDepartureAmount() + 1);
                Long departureDelaySum = FlightRecord.subtractTwoDepartureDates(value.getScheduledDepartureTime(), value.getDepartureTime());
                aggregate.setDepartureDelaySum(aggregate.getDepartureDelaySum() + departureDelaySum);

                aggregate.setArrivalAmount(aggregate.getArrivalAmount());
                aggregate.setArrivalDelaySum(aggregate.getArrivalDelaySum());
            } else if (value.getInfoType().equals("A")) {
                aggregate.setArrivalAmount(aggregate.getArrivalAmount() + 1);
                Long arrivalDelaySum = FlightRecord.subtractTwoArrivalDates(value.getScheduledArrivalTime(), value.getArrivalTime());
                aggregate.setArrivalDelaySum(aggregate.getArrivalDelaySum() + arrivalDelaySum);

                aggregate.setDepartureAmount(aggregate.getDepartureAmount());
                aggregate.setDepartureDelaySum(aggregate.getDepartureDelaySum());
            } else {
                aggregate.setDepartureDelaySum(aggregate.getDepartureDelaySum());
                aggregate.setDepartureAmount(aggregate.getDepartureAmount());
                aggregate.setArrivalAmount(aggregate.getArrivalAmount());
                aggregate.setArrivalDelaySum(aggregate.getArrivalDelaySum());
            }

            return aggregate;
        },
        Materialized.with(Serdes.String(), flightDataSerde)
    );
```

- filter -> sprawdza czy to poprawny event
- selectKey -> wybiera datę jako klucz
- groupByKey -> grupuje dane po kluczu
- windowedBy -> tworzy okno o długości 1 dzień
- aggregate ->
 - jeśli event dotyczy wylotu (D), to inkrementuje liczbę wylotów oraz dodaje opóźnienie w wylocie do sumy opóźnień
 - jeśli event dotyczy przylotu (A), to inkrementuje liczbę przylotów oraz dodaje opóźnienie w przylocie do sumy opóźnień
 - w innym wypadku ustawia poprzednie dane

Utrzymanie obrazu czasu rzeczywistego – obsługa trybu A

W Kafka Streams tryb A działa automatycznie, nie potrzeba żadnych ingerencji w kodzie.

Utrzymanie obrazu czasu rzeczywistego – obsługa trybu C

```
if (delay.equals("C")) {
    return flightDataRecords.suppress(Suppressed.untilWindowCloses(Suppressed.BufferConfig.unbounded()));
}
```

Jeśli program został uruchomiony w obsłudze trybu C, to stosowany jest suppress, który pozwala wysłać dane do tematu kafki dopiero, kiedy okno się zamknie.

Wykrywanie anomalii

```
KTable<Windowed<String>, CountFlightsRecord> countFlightsRecords = flightRecordsIata
    .filter((key, value) -> value.getInfoType().equals("D")) KStream<String, FlightRecord>
    .groupByKey(Grouped.with(Serdes.String(), flightSerde)) KGroupedStream<String, FlightRecord>
    .windowedBy(TimeWindows.ofSizeAndGrace(Duration.ofMinutes(10), Duration.ofMinutes(5))) TimeWindow
    .aggregate(
        CountFlightsRecord::new,
        (key, value, aggregate) -> {
            SimpleDateFormat dateFormat = new SimpleDateFormat(pattern: "yyyy-MM-dd HH:mm:ss");
            try {
                aggregate.setTotalFlights(aggregate.getTotalFlights() + 1);

                Date timeNow = dateFormat.parse(value.getOrderColumn());
                Date timeArrival = dateFormat.parse(value.getScheduledArrivalTime());
                Long duration = timeArrival.getTime() - timeNow.getTime();
                Long diffInMinutes = TimeUnit.MILLISECONDS.toMinutes(duration);

                if (diffInMinutes > 30 && diffInMinutes <= (30 + D)) {
                    aggregate.setUpcomingFlights(aggregate.getUpcomingFlights() + 1);
                } else {
                    aggregate.setUpcomingFlights(aggregate.getUpcomingFlights());
                }

            } catch (ParseException e) {
                throw new RuntimeException(e);
            }

            return aggregate;
        }, Materialized.with(Serdes.String(), countFlightsSerde)
    );
```

- filter -> sprawdzenie czy event to wylot (D)
- groupByKey -> grupuje dane po kluczu (airportIATA)
- windowedBy -> tworzy okno o długości 10 minut, z możliwością opóźnień o 5 minut
- aggregate ->
 - dodaje 1 do sumy lotów
 - sprawdza czy samolot doleci do lotniska między 30 a 30 + D minut
 - jeśli tak, to dodaje 1 do sumy zbliżających się lotów
 - jeśli nie, to zostawia poprzednią sumę

```
return countFlights
    .map(ProcessFlightApplication::extractWindowTimestamps) KStream<String, CountFlightsPeriodRecord>
    .join(airportsTable, flightAirportJoiner, Joined.with(Serdes.String(), flightsPeriodRecordSerde, airportSerde))
    .toTable(Materialized.with(Serdes.String(), enrichedFlightSerde)) KTable<String, EnrichedFlightRecord>
    .mapValues((key, value) -> getAnomalyRecord(value), Materialized.with(Serdes.String(), anomalySerde));
```

- map -> wyciąga dane dotyczące początku i końca okna
- join -> łączy ze sobą dane o liczbie lotów oraz dane o lotniskach

- mapValues ->

```
private static AnomalyRecord getAnomalyRecord(EnrichedFlightRecord value) {
    AirportRecord airportRecord = value.getAirportRecord();
    CountFlightsPeriodRecord countFlightsPeriodRecord = value.getCountFlightsRecord();

    return new AnomalyRecord(
        period: "from: " + countFlightsPeriodRecord.getStartTs() + " to: " + countFlightsPeriodRecord.getEndTs(),
        airportRecord.getName(),
        airportRecord.getIata(),
        airportRecord.getCity(),
        airportRecord.getState(),
        countFlightsPeriodRecord.getCountFlightsRecord().getUpcomingFlights(),
        countFlightsPeriodRecord.getCountFlightsRecord().getTotalFlights()
    );
}
```

zwraca obiekt AnomalyRecord, który posiada wszystkie potrzebne informacje odnośnie anomalii.

Program przetwarzający strumienie danych; skrypt uruchamiający

- a) Działanie w trybie A + mało anomalii

**java -cp /usr/lib/kafka/libs/*:flight-data-processing-kafka-streams.jar
org.example.ProcessFlightApplication 45 10 A \${CLUSTER_NAME}-w-0:9092**

```

Miejsce utrzymywania obrazów czasu rzeczywistego – skrypt tworzący

skrypt tworzący tematy kafka: ***./scripts/02_prepare_kafka.sh***

temat, do którego generowane są dane odnośnie lotów

**kafka-topics.sh --create --topic flights-input --bootstrap-server
\${CLUSTER_NAME}-w-0:9092 --replication-factor 1 --partitions 1**

temat, w którym utrzymywane są informacje o etl

**kafka-topics.sh --create --topic flights-output --bootstrap-server
\${CLUSTER_NAME}-w-0:9092 --replication-factor 1 --partitions 1**

temat, do którego jednokrotnie dodawane są statyczne dane odnośnie lotnisk

**kafka-topics.sh --create --topic airports-input --bootstrap-server
\${CLUSTER_NAME}-w-0:9092 --config cleanup.policy=compact --replication-factor 1
--partitions 1**

temat, w którym utrzymywane są informacje o anomaliach

**kafka-topics.sh --create --bootstrap-server \${CLUSTER_NAME}-w-0:9092 --topic
airports-output --replication-factor 1 --partitions 1**

Miejsce utrzymywania obrazów czasu rzeczywistego – cechy

Wybrałem takie obrazy, ponieważ są one spełniają one wszystkie potrzeby dla naszego projektu: wszystkie informacje są widoczne, można szybko usuwać/tworzyć tematy, nie ma potrzeby instalacji żadnych zewnętrznych narzędzi.

Konsument: skrypt odczytujący wyniki przetwarzania

skrypt uruchamiający konsumenta etl: ***./scripts/03_start_etl_consumer.sh***

```
kafka-console-consumer.sh \  
--bootstrap-server ${CLUSTER_NAME}-w-0:9092 \  
--topic flights-output \  
--formatter kafka.tools.DefaultMessageFormatter \  
--property print.key=true \  
--property print.value=true
```

skrypt uruchamiający konsumenta anomalii: ***.04_start_anomaly_consumer.sh***

```
kafka-console-consumer.sh \  
--bootstrap-server ${CLUSTER_NAME}-w-0:9092 \  
--topic airports-output \  
--formatter kafka.tools.DefaultMessageFormatter \  
--property print.key=true \  
--property print.value=true
```
